

Post-Operative Instructions: Cholecystectomy

Summary: Thank you for trusting your pet to our surgical care. Your dog has had general anesthesia for the surgical removal of the gallbladder, and for culture of the bile and for a liver biopsy. We have monitored your pet for post-operative complications such as bleeding and cardiac arrhythmias (abnormal heart rhythms) and your dog is recovering well at this time. A sample of the tissues from the surgery were submitted to the laboratory for analysis and the biopsy report will be available in about a week. We will call you with the results and make further treatment recommendations, if needed. It is essential to allow your pet time to heal and to avoid re-injury during recuperation. Please strictly follow the instructions below.

Recovery Instructions:

1. Activity:

- No running, jumping, free access to stairs, or rough playing with other pets or children.
- Do not allow any unrestricted or off-leash activity, or free access to stairs or slippery floors.
- Activity must be limited to very short leash walks three times daily for the purpose of going outside to the bathroom only.
- Restrict activity for the next 2 weeks to allow complete healing of the surgical site

2. Incision:

- Monitor the incision daily for signs of infection such as increased redness, swelling or discharge. If you observe any of these signs or if the surgical site suddenly becomes painful to the touch please call us immediately.
- If your pet licks the incision, he/she must wear an E-collar until the staples are removed as licking can provide a source of infection.

- Keep the incision clean and dry (do not apply anything to the incision). No bathing or swimming for 14 days.

3. Medications:

- Give all medications as directed and call us if you believe your pet is having an adverse reaction to any of the prescriptions.
- If your pet loses his/her appetite, begins vomiting or develops diarrhea or dark/tarry stools please call us immediately.

4. Food:

- Your pet should have access to water at all times and eat his/her normal diet

5. Recovery:

- Your pet should show steady, continual improvement. If he/she seems lethargic, acutely painful or simply not doing well please call us immediately.
- Please monitor your pet for signs of a post-surgical complication such as poor or no appetite, lethargy, depression, vomiting, defecation of black or tarry stool, or unanticipated pain/discomfort.

Yellowing of the urine, yellowing of the scleral portions of the eye (whites) or yellowing of mucous membranes, this is an important and emergent development and if you notice any of these signs please call us immediately.

6. Recheck:

- Please schedule an appointment for suture/staple removal 10-12 days after surgery

7. Questions:

- Our foremost interest is your pet's rapid and complete recovery: Do not hesitate to call if you have any questions or concerns.
